**Notebook, N-00-05-01**

This notebook covers the periods May and November 1900. Most of the book contains notes by an unidentified experimenter regarding tests of a compressed air engine and dust separation apparatus. There is also a one-page entry by Edison pertaining to an experimental carbon-iron storage battery. The pages are unnumbered. Approximately 70 pages have been used.

Only the entry by Edison has been selected.

20 Nov 1900 —

Experts from in Carbon Elec Aborings B —

One plate Charcoal thro 150 on 200 —
soaked about $FeCl_2$ - dried - soaked - then dried
+ plunged — hot 20% KOH — allowed to remain
in KOH till Cool — then Soaked — water
Containing a little KOH for ——— hours —
then in pure water for ——— hours —
then dried + ~~———~~ resoaked in more
$FeCl_2$ + same operation gone over with —

---

Little same as above with 3.2 gms
plate Carbon having had $CaCl_2$ + $NH_4$ — to
increase porosity —
